

DIY WORM TUBE

THE FACTS ABOUT WORM TUBES

Worm tubes are ideal for the **natural disposal of organic waste.**

These 'feeding stations' can be easily set-up on any site and make a great fertiliser for your garden while saving space in your bin.

ITEMS TO AVOID:

- » Meat and dairy
- » Junk food (also attracts ants)
- » Citrus – it's toxic to worms!

WORM FRIENDLY FOOD

- » Organic garden clippings
- » Fruit and veg scraps
- » Egg shells
- » Tea and coffee grounds
- » Shredded paper/newspaper

HOW TO MAKE A WORM TUBE

Step 1

Use an empty 10L-20L plastic bucket with a lid. The lid stops flies, rodents and cockroaches entering the tube.

Step 2

Remove the base of the bucket, then drill or punch holes in the lower third of the bucket sides.

Step 3

Dig a hole in the garden and stand the worm tube inside. Push soil up around the bucket to cover the worm holes.

Step 4

Lift the lid and add some food scraps, tea bags, coffee grounds, or any other organic waste. Remember to put the lid back on!
